SUMMARY

Cybersecurity analyst working Tier 1 SOC alert triage and incident response in Splunk ES and IBM QRadar, hands-on with Microsoft Sentinel, Splunk and Wazuh on live honeypot data, with three and a half years of freelance IT support for small businesses. CompTIA Security+ certified. Builds and runs a live SSH/Telnet honeypot that streams to Microsoft Sentinel, with Sigma detections tested in CI and SOAR playbooks that enrich every incident.

TECHNICAL SKILLS

SIEM, EDR and IDS	Microsoft Sentinel, Splunk Enterprise Security, Wazuh, IBM QRadar, CrowdStrike Falcon, Suricata
Security operations	Tier 1 alert triage, escalation, incident response workflow, phishing email analysis, false-positive reduction and rule tuning, incident reports, Jira ticketing
Detection engineering	Sigma, Splunk SPL, KQL, MITRE ATT&CK mapping, detection testing in CI (GitHub Actions), SOAR playbooks (Azure Logic Apps)
Threat intelligence and analysis	VirusTotal, Shodan, AbuseIPDB, CyberChef (URL decoding, JSON parsing, user-agent analysis)
Network and vulnerability	Wireshark, Nmap, Nessus
Cloud	Microsoft Azure (Log Analytics, Azure Monitor data collection rules, Entra ID service principals); AWS, Alibaba Cloud, Linode
Operating systems and containers	Kali Linux, Ubuntu Server, Debian, Windows 11; Docker
Networking	Network troubleshooting; isolated host-only lab network; iptables egress filtering
Scripting	Python, Bash
Coursework	Active Directory, PowerShell
Languages	English, Turkish, Chinese

EXPERIENCE

SOC Analyst, Cydeo (Remote) Apr 2026 - Present

- Monitor security alerts in Splunk Enterprise Security and IBM QRadar to identify suspicious activity and potential threats.
- Perform Tier 1 triage by analyzing logs, network traffic and endpoint data to determine severity and reduce false positives.
- Analyze alerts from Suricata and CrowdStrike Falcon.
- Investigate indicators such as IP reputation, URLs and user activity with VirusTotal and Shodan.
- Decode and analyze suspicious payloads and logs with CyberChef (URL decoding, JSON parsing, user-agent analysis).
- Support phishing investigations by analyzing email headers, links and attachments.
- Document incidents in Jira, track them there and escalate confirmed threats to Tier 2 analysts through Jira, following established procedures.
- Help reduce false positives through rule tuning and alert analysis.

IT Support Specialist (Freelance), Self-employed (Türkiye, remote) Sep 2022 - Mar 2026

- Reviewed system and application logs and investigated API request timeouts and network issues to restore service.
- Supported users at three small businesses, about four users each, by phone, messaging and remote desktop (TeamViewer, AnyDesk).
- Supported the businesses' payment websites, admin back ends, APIs and API integrations, hosted on AWS, Alibaba Cloud and Linode.

PROJECTS

Honeypot Threat Intelligence and SIEM Pipeline, honeypot.uig.me Nov 2026 - Present

- Deployed a hardened Cowrie SSH/Telnet honeypot on a cloud VPS (read-only container, no capabilities, outbound traffic blocked) that captures live attacks from botnets worldwide.
- Mapped each session to MITRE ATT&CK, enriched source IPs with AbuseIPDB and published hourly stats and weekly threat reports without exposing IP addresses.
- Streamed raw events to Microsoft Sentinel every 10 minutes with the Azure Monitor Logs Ingestion API and a least-privilege service principal.
- Built a Splunk app for the same logs with field extractions, an ATT&CK tagging macro, an IP reputation lookup, a dashboard and 7 scheduled detections.

Detection-as-Code and SOAR: Sigma to Splunk and Microsoft Sentinel, detections.uig.me Nov 2026 - Present

- Wrote 17 Sigma rules covering 18 MITRE ATT&CK techniques, based on attacker behaviour seen on the honeypot (botnet droppers, SSH key persistence, crypto-mining).
- Built a CI pipeline that tests every rule against 70 attack and 99 look-alike events and converts it to Splunk SPL and KQL; a missed attack or a false positive fails the build.
- Verified the converted queries in Splunk and Microsoft Sentinel and deployed them as Sentinel analytics rules that raise one incident per attacking IP on live honeypot data.
- Built SOAR playbooks (Azure Logic Apps) that enrich every new Sentinel incident with AbuseIPDB and 30 days of honeypot history, triage it automatically and send High incidents to Telegram.

SOC Field Guide: Microsoft Sentinel, Splunk and Wazuh on Real Data, guide.uig.me Nov 2026 - Present

- Wrote 5 investigation playbooks (download-and-execute, credential logins, persistence, scan-then-login, Suricata signature triage) in KQL, SPL and Wazuh, verified to return the same results on the same day of honeypot data.
- Investigated a one-second Telnet dropper from first packet to verdict in Sentinel, Splunk and Wazuh and published the incident report on uig.me.
- Wrote custom Wazuh rules that chain attack steps by Cowrie session instead of source IP, so replayed logs still correlate.
- Pseudonymized all published data with a salted hash; the site build fails if a public IP, email or GUID appears.

Cybersecurity Home Lab, lab.uig.me 2026

- Built an isolated lab in UTM with Kali Linux, Ubuntu Server, Windows 11 and a Wazuh SIEM on a host-only network.
- Ran controlled Nmap scans and SSH and RDP brute-force tests from Kali and reviewed the Wazuh alerts they raised.
- Maintain a Bash CLI and Docker labs with automated checks (Linux, networking, Splunk, Wazuh, Active Directory); passed labs are published at lab.uig.me.

EDUCATION

IT Service Technician (16-week employment training program), Solomon College, Edmonton Jul 2026 - Nov 2026

Bachelor's degree, Exploration Technology and Engineering, Jilin University, China Sep 2008 - Jul 2012
